AnTek Inc. www.antekinc.com

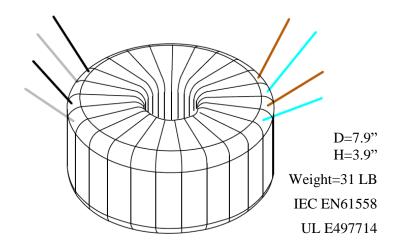

The 2000VA industrial toroidal power transformer offers higher efficiency than EI transformers, typically ranging up to 97%. Due to its effective containment of magnetic flux within the core, it significantly reduces interference with nearby components. Additionally, it generates a lot less mechanical humming and heat.

The AU series transformers are specifically designed to operate with standard 240V and 480V 60Hz power source. They feature heavier gauge copper wires than standard requirements to minimize wire loss at full power output. The dielectric leakage current test withstands up to 3500Vac between the primary and secondary coils.

This transformer includes base plate, two rubber pads, a holding disk, and a center bolt assembly.

Open Circuit Test (core loss test): TEST CONDITION: Apply variable voltage to primary wires (0-240V tap). Set voltages 240 and 280VAC at 60Hz. No load on secondary coils. Measure the primary current and input power.	Voltage input	Current input		Power lost
	240V 280V	.055A .085A		9.6W 14.5W
Short Circuit Test (copper loss test):	Voltage input	Current rated		Power lost
TEST CONDITION: Short all secondary coils, and apply variable voltage to (parallel) primary coils. Vary the voltage from 0-20VAC at 60Hz and freeze the voltage at rated primary current.	5.61V	8.35A		46.8W
Load Test (operation test): TEST CONDITION: Apply 240VAC, 60Hz to the primary coils (0-240V). Connect Output 1 and Output 2 in parallel to the load. Measure the voltage and current at different load levels. The total internal impedance of the transformer can be determined as $\Delta V/\Delta I$.	Voltage output	Current output		Power output
	120.7V 119.2V	0.0A 2.4A		0W 286W
DC Resistant Test: DC Milli-Ohm Meter: Test primary (0-240V) and secondary coils (value	Primary S		Se	condary
for each coil).	0.64 ohm		0.19 ohm
